

Script Doc — NLIO Dedup: align 13403 to Erlinda + close duplicate 13392

Script: `scripts/pending/2026_08_05_fix_nlio_dedup_erlinda_13403_close_13392.php` **Date:** 2026-08-05 · **Connection:** `mysql_secondary` (SAERP) · **Author:** Kervin Fugata **Type:** one-off data correction · identity-only · zero money movement

1. Case scenario (why this script exists)

Two WIP projects existed for a single interment, and the money was paid against the wrong one:

	13403 (keep)	13392 (retire)
Doc no	NWIP0001398	NWIP1700046
Created by	Java ERP desktop	Online Interment Application
Status	COMMENCED	BUDGETING
Linked order (before)	1865 = NLIO00934-CA (cancelled — Superlativo)	1858 = NLIO00931 (live — Erlinda)
Occupant	FSUPT. JIMMY G. SUPERLATIVO SR.	ERLINDA / RONIE / CHRISTOPHER MAGBANUA
Standard	630 (W/O MASS)	629 (W/ MASS)
Payouts	21 PR — 7 debts settled ₱9,818.74, outstanding 0	6 DR (draft only, nothing disbursed)

What happened: project 13403 was commenced for Superlativo, whose order was later **cancelled** (`NLIO00934-CA`) — but ₱518.74 of materials had already been consumed and paid on it. Erlinda's real project 13392 was stuck in **BUDGETING**, so it could not carry actual payouts. The team repurposed the already-commenced 13403 for Erlinda (renamed it, processed all her payouts there). That fixed **where the money sits** but left 13403's deep identity — its **order link, occupant, standard, and subaccount pointer** — still pointing at the cancelled Superlativo record.

What this script does: finishes the alignment as an **identity-only** correction and closes the duplicate. It moves **no money** and touches **no ledger** — the paid payouts/liquidations are immutable and simply belong to Erlinda once the project points at her order.

> Full investigation & proof: core-system `docs/case-nlio-duplicate-erlinda-superlativo.md` (+ PDF).

2. What the script function does (operation by operation)

The file returns a closure `function ($cmd)` ; the runner wraps it, but because writes target `mysql_secondary` the closure opens its **own** transaction on that connection. All seven operations run in **one atomic transaction**, each **guarded on its current value** (idempotent).

Op	Table	Change	Guard / self-heal	
A1	mp_t_interment_order_project (row 1269)	order 1865 → 1858	only if currently 1865; occupancy follows to Magbanua automatically	
A2	mp_t_interment_order_project (row 1265)	is_active 1 → 0	releases 13392's grip on the live order	
A6	wip_i_project 13403	gl_subacct_id 40907 → 41009	restores the project's owned subaccount (matches locator x + all 14 GL postings); a stray 40907 came from the manual rename	
SH	wip_i_project 13403	std 629 → 630	self-heals a v1-test leftover; no-op on pristine live (std must match the built scopes)	
B1	wip_t_lmc_payout 55506–55511	docstatus DR → VO	voids 6 draft payouts (never processed)	
B2	wip_i_project 13392	`BUDGETING\`	HALTED → CLOSED`	MD directive: CLOSE the duplicate (accepts a prior HALTED too)
B3	wip_l_project_status_change	INSERT CLOSED audit row for 13392	only if none exists; s_bpartner_id looked up for person 1967	

Standard is intentionally left at 630 — the scopes/BOM/LMC were built from 630, and 629 vs 630 differ only by a ₱158 vigil-candle price. The project **name** already reads "W/ MASS".

After the writes, an **in-transaction VERIFY block** asserts the aligned end-state (see §4). If any assertion fails, the whole transaction rolls back and the script throws — the deploy pipeline then quarantines the file to `scripts/failed/` and records the error on the `/scripts` dashboard.

3. Integrity — accounting & inventory (why it's safe)

The script writes to **only 4 tables**: `mp_t_interment_order_project`, `wip_i_project` (header), `wip_t_lmc_payout` (drafts), `wip_l_project_status_change`. It writes **nothing** to:

- **Accounting:** `acct_gl`, `acct_balance`, `fin_l_debt`, `fin_l_debt_history`, `fin_s_advances`, `fin_t_payment`
- **Inventory:** `wip_l_bomline_bal`, `wip_t_bomline`, `nvt_i_locator`, any stockcard table

Verified facts:

- **13403's GL** (14 rows under subaccount 41009) and its **settled debts** (350482/350483, outstanding 0.00) are untouched. A6 only fixes the *header pointer* to match where postings already are — it re-posts nothing.
- **13392 has 0 consumed materials, 0 GL rows, 0 debts** → closing it strands/reverses nothing; voiding *draft* payouts has no GL/AP effect.

- Where the script touches a pointer (A6, SH) it **restores** consistency the manual rename broke (header now matches the owned subaccount 41009 and the built standard 630).

Net: accounting and inventory come out **untouched or more consistent — never degraded**.

4. Verification (built into the script)

The closure asserts all of these before committing (and they're also runnable standalone from core-system `docs/sql/verify_fix_applied.sql`):

Check	Expected
A1 order link (bridge 1269)	1858 (NLIO00931)
A2 bridge 1265	is_active 0
A6 13403 gl_subacct_id	41009
STD 13403 standard	630
B1 drafts 55506–55511	VO ×6
B2 13392 status	CLOSED
B3 13392 audit row	present
OCC order 1858 occupants	contains MAGBANUA
MONEY debts 350482/350483	outstanding 0.00
NEG cancelled order 1865	0 active project links

5. How to run

Local dry-run (no writes — rolls back): `""bash`

set \$DRY_RUN = true in the script first

`php artisan scripts:run-one scripts/pending/2026_08_05_fix_nlio_dedup_erlinda_13403_close_13392.php ""`

Pipeline (governed):

- Commit on `staging` → runs on **staging** on deploy.
- Commit on `main` → runs on **production** on deploy.
- Gated by the `/scripts` review/approval dashboard; success moves the file to `done/`, failure to

`failed/` (changes rolled back). Every run is recorded in `script_runs`.

6. Rollback

The script is idempotent and re-runnable. To revert after a run, the inverse is the core-system `docs/sql/rollback_nlio_duplicate_erlinda_v2.sql` sequence (order 1858→1865, is_active 0→1, subacct 41009→40907, VO→DR, CLOSED→BUDGETING, delete the CLOSED audit row). Note the pre-fix baseline: order 1865, std 630, 13392 BUDGETING, drafts DR, header gl_subacct 40907.

7. Key identifiers (quick reference)

- Projects: **13403** keep (COMMENCED), **13392** retire (BUDGETING→CLOSED)
- Bridge rows: **1269** (13403↔order), **1265** (13392↔order)
- Orders: **1858** **NLI000931** live (Erlinda), **1865** **NLI000934-CA** cancelled (Superlativo)
- Subaccount: **41009** (owned/correct), 40907 (stray)
- Standard: **630** (built), 629 (W/ MASS label)
- Draft payouts voided: **55506–55511**
- Settled debts (untouched): **350482, 350483**
- Status processor: person **1967**
